## **FM RECEIVER CIRCUIT FOR BATTERY SUPPLY**

### **DESCRIPTION**

The UTC TDA7088 is a bipolar integrated circuit for use in mono portable and pocket radios. It is used when a minimum of peripheral components (of small dimensions and low costs) is important. The circuit contains a frequency-locked-loop(FLL) system with an Intermediate Frequency (IF) of about 70kHz. Selectivity is achieved by active RC-filters. Detuning related to the IF and too weak input signals is suppressed by the mute circuit.

SOP-16

### **FEATURES**

- \*Equipped with all stages of a mono receiver from antenna to audio output.
- \*Mute circuit
- \*Search tuning with a single varicap diode
- \*Mechanical tuning with integrating AFC
- \*AM application supported
- \*Power supply polarity protection
- \*Power supply voltage down to 1.8V

### **APPLICATIONS**

- \*Mechanical tuning ; this is possible with or without integrating AFC circuit
- \*Electrical tuning; this is realized by one directional (band-up) search tuning facility, including RESET to the lower-band limit.

### **ABSOLUTE MAXIMUM RATINGS**
