## PRODUCT DESCRIPTION

The UT28F64LV amorphous silicon anti-fuse PROM is a high performance, asynchronous, radiation-hardened, 8K x 8 programmable memory device. The UT28F64LV PROM features fully asynchronous operation requiring no external clocks or timing strobes. An advanced radiation-hardened twin-well CMOS process technology is used to implement the UT28F64LV. The combination of radiation- hardness, fast access time, and low power consumption make the UT28F64LV ideal for high speed systems designed for operation in radiation environments.

## DEVICE OPERATION

The UT28F64LV has three control inputs:  $\overline{\text{CE}}$  (Chip Enable),  $\overline{\text{PE}}$  (Program Enable), and  $\overline{\text{OE}}$  (Output Enable); thirteen address inputs, A(12:0); and eight bidirectional data lines, DQ(7:0).  $\overline{\text{CE}}$  is the device enable input that controls chip selection, active, and standby modes. Asserting  $\overline{\text{CE}}$  causes  $I_{\text{DD}}$  to rise to its active value and decodes the thirteen address inputs to select one of 8,192 words in the memory.  $\overline{\text{PE}}$  controls program and read operations. During a read cycle,  $\overline{\text{OE}}$  must be asserted to enable the outputs.

2. Supplied as a design limit but not guaranteed or tested.

3. Not more than one output may be shorted at a time for maximum duration of one second.

## READ CYCLE

A combination of  $\overline{PE}$  greater than  $V_{IH}(\text{min})$ , and  $\overline{CE}$  less than  $V_{IL}(\text{max})$  defines a read cycle. Read access time is measured from the latter of device enable, output enable, or valid address to valid data output.

An address access read is initiated by a change in address inputs while the chip is enabled with  $\overline{OE}$  asserted and  $\overline{PE}$  deasserted. Valid data appears on data output, DQ(7:0), after the specified  $t_{AVQV}$  is satisfied. Outputs remain active throughout the entire cycle. As long as device enable and output enable are active, the address inputs may change at a rate equal to the minimum read cycle time.

The chip enable-controlled access is initiated by  $\overline{CE}$  going active while  $\overline{OE}$  remains asserted,  $\overline{PE}$  remains deasserted, and the addresses remain stable for the entire cycle. After the specified  $t_{ELQV}$  is satisfied, the eight-bit word addressed by A(12:0) appears at the data outputs DQ(7:0).

Output enable-controlled access is initiated by  $\overline{OE}$  going active while  $\overline{CE}$  is asserted,  $\overline{PE}$  is deasserted, and the addresses are stable. Read access time is  $t_{GLQV}$  unless  $t_{AVQV}$  or  $t_{ELQV}$  have not been satisfied.

**RADIATION HARDNESS**

The UT28F64LV PROM incorporates special design and layout features which allow operation in high-level radiation environments. UPMC has developed special low-temperature processing techniques designed to enhance the total-dose radiation hardness of both the gate oxide and the field oxide while

maintaining the circuit density and reliability. For transient radiation hardness and latchup immunity, UPMC builds all radiation-hardened products on epitaxial wafers using an advanced twin-tub CMOS process. In addition, UPMC pays special attention to power and ground distribution during the design phase, minimizing dose-rate upset caused by rail collapse.
