

UT8R256K16 256K x 16 SRAM

October 9, 2002

FEATURES

- ❑ 15ns maximum access time
- ❑ Asynchronous operation, functionally compatible with industry-standard 256K x 16 SRAMs
- ❑ CMOS compatible inputs and output levels, three-state bidirectional data bus
 - I/O Voltage 2.5 to 3.3 volts, 1.8 volt core
- ❑ Radiation performance
 - Intrinsic total-dose: 100K rad(Si)
 - SEL Immune >100 MeV-cm²/mg
 - Onset LET > 24 MeV-cm²/mg
 - Memory Cell Saturated Cross Section, 1.0 x 10⁻⁸cm²/bit
 - 1.0E x 10⁻¹⁰ errors/bit-day, Adams to 90% geosynchronous heavy ion
 - Neutron Fluence: 3.0E14n/cm²
 - Dose Rate (estimated)
 - Upset 1.0E9 rad(Si)/sec
 - Latchup >1.0E11 rad(Si)/sec
- ❑ Packaging options:
 - TBD
- ❑ Standard Microcircuit Drawing pending
 - QML compliant part

INTRODUCTION

The UT8R256K16 is a high-performance CMOS static RAM organized as 262,144 words by 16 bits. Easy memory expansion is provided by active LOW and HIGH chip enables ($\overline{E1}$, E2), an active LOW output enable (\overline{G}), and three-state drivers. This device has a power-down feature that reduces power consumption by more than 90% when deselected.

Writing to the device is accomplished by taking chip enable one ($\overline{E1}$) input LOW, chip enable two (E2) HIGH and write enable (\overline{W}) input LOW. Data on the 16 I/O pins (DQ0 through DQ15) is then written into the location specified on the address pins (A0 through A17). Reading from the device is accomplished by taking chip enable one ($\overline{E1}$) and output enable (\overline{G}) LOW while forcing write enable (\overline{W}) and chip enable two (E2) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The 16 input/output pins (DQ0 through DQ15) are placed in a high impedance state when the device is deselected ($\overline{E1}$ HIGH or E2 LOW), the outputs are disabled (\overline{G} HIGH), or during a write operation ($\overline{E1}$ LOW, E2 HIGH and \overline{W} LOW).

DEVICE OPERATION

The UT8R256K16 has four control inputs called Enable 1 ($\overline{E1}$), Enable 2 (E2), Write Enable (\overline{W}), Half-word Enables (BLE/ \overline{BHE}) and Output Enable (\overline{G}); 18 address inputs, A(17:0); and 16 bidirectional data lines, DQ(15:0). $\overline{E1}$ and E2 device enables control device selection, active, and standby modes. Asserting $\overline{E1}$ and E2 enables the device, causes I_{DD} to rise to its active value, and decodes the 18 address inputs to select one of 262,144 words in the memory. \overline{W} controls read and write operations. During a read cycle, \overline{G} must be asserted to enable the outputs.

- Notes:**
1. "X" is defined as a "don't care" condition.
2. Device active; outputs disabled.

READ CYCLE

A combination of \overline{W} and E2 greater than $V_{IH}(\min)$ and $\overline{E1}$ less than $V_{IL}(\max)$ defines a read cycle. Read access time is measured from the latter of device enable, output enable, or valid address to valid data output.

SRAM Read Cycle 1, the Address Access in Figure 3a, is initiated by a change in address inputs while the chip is enabled with G asserted and \overline{W} deasserted. Valid data appears on data outputs DQ(15:0) after the specified t_{AVQV} is satisfied. Outputs remain active throughout the entire cycle. As long as device enable and output enable are active, the address inputs may change at a rate equal to the minimum read cycle time (t_{AAV}).

SRAM Read Cycle 2, the Chip Enable-controlled Access in Figure 3b, is initiated by the latter of $\overline{E1}$ and E2 going active while G remains asserted, \overline{W} remains deasserted, and the addresses remain stable for the entire cycle. After the specified t_{ETQV} is satisfied, the 16-bit word addressed by A(17:0) is accessed and appears at the data outputs DQ(15:0).

SRAM Read Cycle 3, the Output Enable-controlled Access in Figure 3c, is initiated by G going active while $\overline{E1}$ and E2 are asserted, \overline{W} is deasserted, and the addresses are stable. Read access time is t_{GLQV} unless t_{AVQV} or t_{ETQV} have not been satisfied.

Write Cycle

A combination of \overline{W} and $\overline{E1}$ less than $V_{IL}(\max)$ and E2 greater than $V_{IH}(\min)$ defines a write cycle. The state of G is a “don’t care” for a write cycle. The outputs are placed in the high-impedance state when either G is greater than $V_{IH}(\min)$, or when \overline{W} is less than $V_{IL}(\max)$.

Write Cycle 1, the Write Enable-controlled Access in Figure 4a, is defined by a write terminated by \overline{W} going high, with $\overline{E1}$ and E2 still active. The write pulse width is defined by t_{WLWH} when the write is initiated by \overline{W} , and by t_{ETWH} when the write is initiated by $\overline{E1}$ or E2. Unless the outputs have been previously placed in the high-impedance state by G, the user must wait user must wait t_{WLQZ} before applying data to the 16 bidirectional pins DQ(15:0) to avoid bus contention.

Write Cycle 2, the Chip Enable-controlled Access in Figure 4b, is defined by a write terminated by the latter of $\overline{E1}$ or E2 going inactive. The write pulse width is defined by t_{WLEF} when the write is initiated by \overline{W} , and by t_{ETEF} when the write is initiated by either $\overline{E1}$ or E2 going active. For the \overline{W} initiated write, unless the outputs have been previously placed in the

high-impedance state by \overline{G} , the user must wait t_{WLQZ} before applying data to the sixteen bidirectional pins DQ(15:0) to avoid bus contention.

BYTE ENABLES

Separate byte enable controls (\overline{BLE} and \overline{BHE}) allow individual bytes to be accessed. \overline{BLE} controls the lower bits DQ(7:0). \overline{BHE} controls the upper bits DQ(15:8). Writing to the device is performed by asserting $\overline{E1}$, E2 and the byte enables. Reading the device is performed by asserting $\overline{E1}$, E2, G, and the byte enables while \overline{W} is held inactive (HIGH).

\overline{BHE}	\overline{BLE}	OPERATION
0	0	16-bit read or write cycle
0	1	8-bit high byte read or write cycle (low byte bi-direction pins DQ(7:0) are in 3-state)
1	0	8-bit low byte read or write cycle (high byte bi-direction pins DQ(15:8) are in 3-state)
1	1	High and Low byte bi-directional pins remain in 3-state, write function disabled

RADIATION HARDNESS

The UT8R256K16 SRAM incorporates special design, layout, and process features which allows operation in a limited radiation environment.

Table 2. Radiation Hardness Design Specifications¹

Total Dose	100K	rad(Si)
Heavy Ion Error Rate ²	1.0E-10	Errors/Bit-Day

Notes:

1. The SRAM is immune to latchup to particles of 128MeV-cm²/mg.
2. 10% worst case particle environment, Geosynchronous orbit, 0.025 mils of Aluminum.

Supply Sequencing

No supply voltage sequencing is required between V_{DD1} and V_{DD2} .

ABSOLUTE MAXIMUM RATINGS¹

(Referenced to V_{SS})

SYMBOL	PARAMETER	LIMITS
V_{DD1}	DC supply voltage	-0.3 to 2.0V
V_{DD2}	DC supply voltage	-0.3 to 3.8V
V_{IO}	Voltage on any pin	-0.3 to 3.8V
T_{STG}	Storage temperature	-65 to +150°C

T_J	Maximum junction temperature	+150°C
Θ_{JC}	Thermal resistance, junction-to-case ²	5°C/W
I_I	DC input current	±5 mA

Notes:

1. Stresses outside the listed absolute maximum ratings may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond limits indicated in the operational sections of this specification is not recommended. Exposure to absolute maximum rating conditions for extended periods may affect device reliability and performance.
3. Test per MIL-STD-883, Method 1012.

Notes:

* Post-radiation performance guaranteed at 25°C per MIL-STD-883 Method 1019 at 1.0E5 rad(Si).

1. Measured only for initial qualification and after process or design changes that could affect input/output capacitance.

2. Supplied as a design limit but not guaranteed or tested.

3. Not more than one output may be shorted at a time for maximum duration of one second.

4. $V_{IH} = V_{DD2}(\max), V_{IL} = 0V.$

* Post-radiation performance guaranteed at 25°C per MIL-STD-883 Method 1019.

1. Guaranteed but not tested (G high).

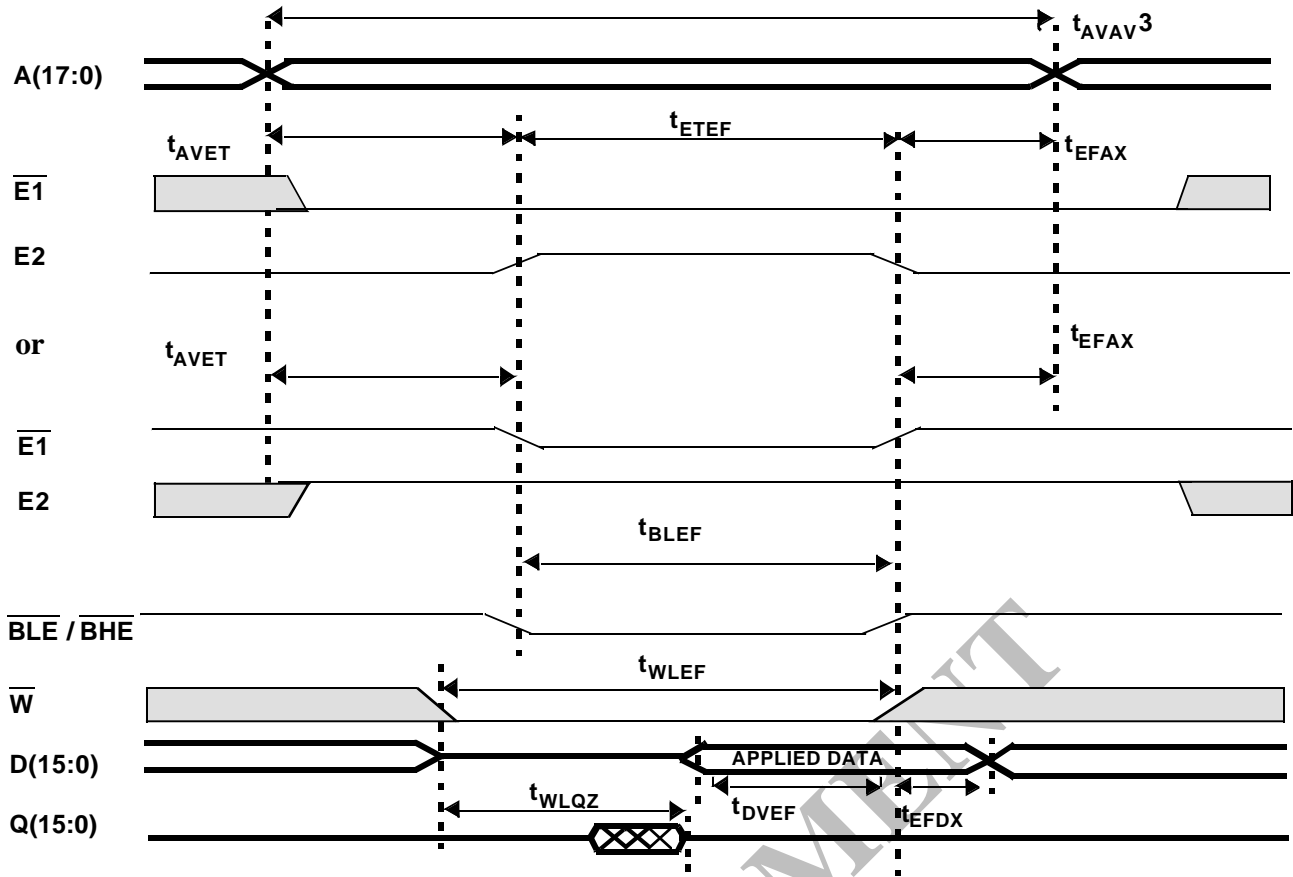

2. Three-state is defined as 200mV change from steady-state output voltage.

Assumptions:

1. $G \leq V_{IL}(\text{max})$. If $G \geq V_{IH}(\text{min})$ then Q(15:0) will be $\underline{0}$ in three-state for the entire cycle.
2. G high for t_{AVAV} cycle.

ORDERING INFORMATION

256K x 16 SRAM

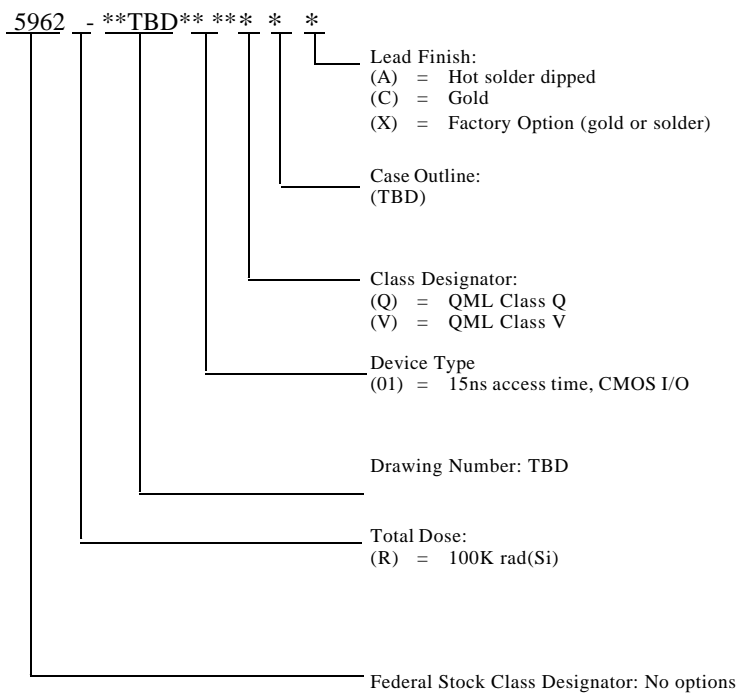

Notes:

1. Lead finish (A,C, or X) must be specified.
2. If an "X" is specified when ordering, then the part marking will match the lead finish and will be either "A" (solder) or "C" (gold).
3. Prototype flow per UPMC Manufacturing Flows Document. Tested at 25°C only. Lead finish is GOLD ONLY. Radiation neither tested nor guaranteed.
4. Military Temperature Range flow per UPMC Manufacturing Flows Document. Devices are tested at -55°C, room temp, and 125°C. Radiation neither tested nor guaranteed.
