TIMING WAVEFORMS

READ CYCLE 1 (Address Controlled) (1,2,4)

READ CYCLE 2 ($\overline{CE1}$ and $\overline{CE2}$ and \overline{OE} Controlled) (1,3,5,6)

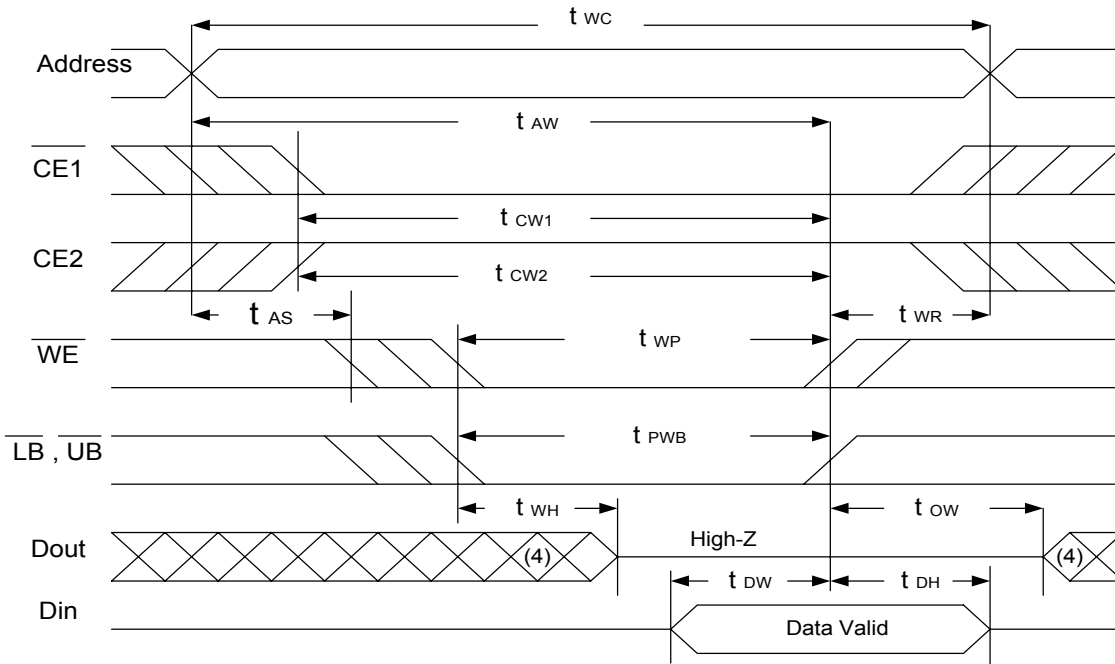

Notes :

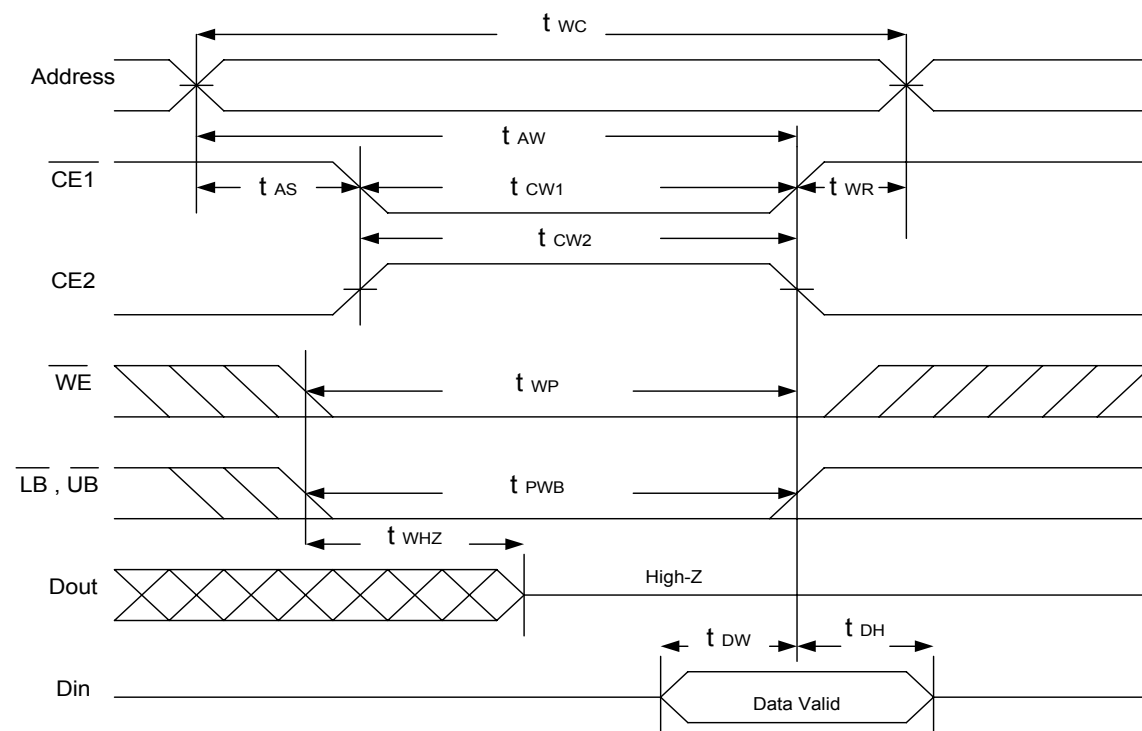

- \overline{WE} is HIGH for read cycle.
- Device is continuously selected $\overline{CE1}=V_{IL}$ and $\overline{CE2}=V_{IH}$. and $\overline{LB}=V_{IL}$ and $\overline{UB}=V_{IH}$.
- Address must be valid prior to or coincident with $\overline{CE1}$ and $\overline{CE2}$ and \overline{LB} and \overline{UB} transition; otherwise t_{AA} is the limiting parameter.
- \overline{OE} is low.
- t_{CLZ1} , t_{CLZ2} , t_{OLZ} , t_{CHZ1} , t_{CHZ2} and t_{OHZ} are specified with $C_L=5pF$. Transition is measured $\pm 500mV$ from steady state.
- At any given temperature and voltage condition, t_{CHZ1} is less than t_{CLZ1} , t_{CHZ2} is less than t_{CLZ2} , t_{OHZ} is less than t_{OLZ} .

WRITE CYCLE 1 (\overline{WE} Controlled) (1,2,3,5)

WRITE CYCLE 2 ($\overline{CE1}$ and $\overline{CE2}$ Controlled) (1,2,5)

Notes :

1. \overline{WE} or $\overline{CE1}$ must be HIGH during all address transitions.
2. A write occurs during the overlap of a low $\overline{CE1}$ and a low \overline{WE} .
3. During a \overline{WE} controlled with write cycle with \overline{OE} LOW, t_{WP} must be greater than $t_{WHZ} + t_{DW}$ to allow the drivers to turn off and data to be placed on the bus.
4. During this period, I/O pins are in the output state, and input signals must not be applied.
5. If the $\overline{CE1}$ LOW transition occurs simultaneously with or after \overline{WE} LOW transition, the outputs remain in a high impedance state.
6. t_{OW} and t_{WHZ} are specified with $C_L = 5pF$. Transition is measured $\pm 500mV$ from steady state.
